INTRODUCTION

Hey everyone. In this guide, I will be showing you how to put your iPod Classic into Debug mode.

Step 1 — Rebooting your iPod

- Press down on the Center and Menu buttons until the iPod restarts.

- If your iPod is dead, plug it in and make sure the Hold Switch located on top of the device is in the unlocked position.

ⓘ When you do this, it's important to restart into the iPod's default OS.

Step 2 — Accessing Debug mode

- Hold down the Previous Track and Center buttons.

- The screen should display the Apple logo. Once the screen turns white, it is safe to release the two buttons.

Step 3 — Navigation of the Debug Menu

- Navigation of the Menu will help out with using the iPod to figure out it's problem.

- Press Menu to return to the previous screen, or the next screen in some cases.

- The Centre button executes the function currently selected.

- Skip Track and Previous Track buttons are used to scroll through the lines.
